

Fetlock joint

- lateral approach

Volume of local anesthetics: 8-12 ml at each site.

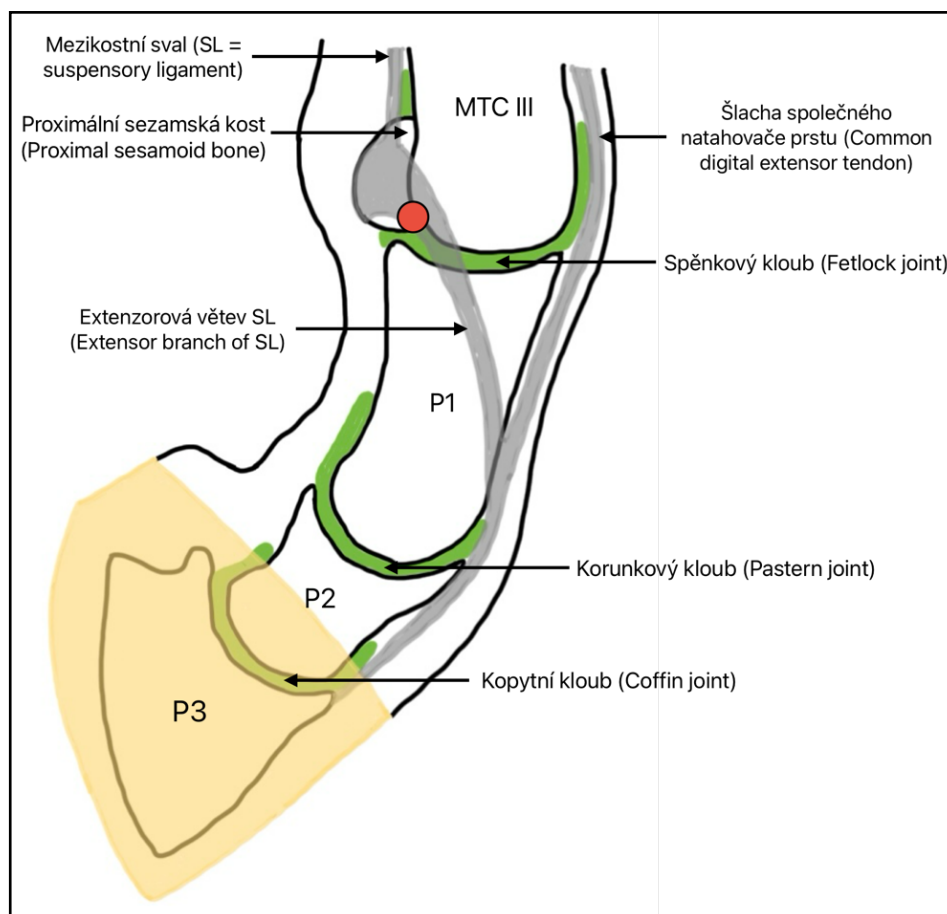

Limb in a flexed position.

Is the best approach to get a hemorrhage – free synovial fluid sample.

Injection technique:

Also known as a collateral sesamoidean approach.

Insert the needle through the lateral collateral sesamoidean ligament, between the articular surfaces of the proximal sesamoid bones and the articular surface of the third metacarpal/metatarsal bone.

The injection site is between the articular surface of the third metacarpal/metatarsal bone and the articular surface of the proximal sesamoid bones.

The needle in place.
